

NFL ChatGPT Model — 5-Layer Moneyline Breakdown Prompt

Purpose: Feed in any NFL slate with matchups and current prices. Get a complete, data-driven read on moneylines (and optional alt angles) with clear edges vs the market.

How to use: Paste the slate (games + best available prices + book if you have it). The model will pull/organize stats, compare to market, and return a table + compact notes.

INPUT FORMAT (example)

Provide as a list. Include odds in American (and book if known).

WEEK: 7 (2025)

GAMES:

- Bills @ Dolphins - MIA -145 (FanDuel), BUF +125 (DraftKings)
- Lions @ Vikings - DET -120 (Pinnacle), MIN +105 (BetMGM)
- Cowboys @ Eagles - PHI -135 (Circa), DAL +115 (FanDuel)

CONTEXT NOTES (optional):

- Weather checks requested
 - Watch key injuries: Tyreek (ankle Q), MIN LT out?, DAL CB cluster?
-

LAYER 1: Team Résumé & Strength of Schedule (SoS)

Weight **last 18 months** = 60%, prior = 40%. Emphasize current season and last 8–10 games.

Track and compare (offense/defense + net):

- **EPA/play, Success Rate (SR)**, early-down EPA, explosive play rate (gained/allowed), net EPA per drive
- **Schedule-adjusted** performance (SoS: opponents' EPA/SR; optionally DVOA/SRS if available)
- **One-score game luck** (close-game record vs expected wins)
- **Rest differentials** (bye, mini-bye after TNF, short week, travel mileage/time zones)
- **Cluster injuries** history (OL, WR/CB rooms) impacting past results
- **Turnover luck** (TO margin vs **turnover-worthy play** rate and fumble luck)
- **Hidden points**: starting field position, penalties/penalty EPA, special teams value

Red flags: records built vs bottom-10 defenses/QBs, inflated point diff from defensive/ST TDs, unsustainably high RZ TD% without supporting EPA.

LAYER 2: Technical & Matchup Fit

Translate MMA's "style vs style" to football's "unit-on-unit" chess match.

QB & Passing Offense vs Coverage

- QB: **EPA/play, CPOE, aDOT, pressure-to-sack rate, TWP% (turnover-worthy plays), scramble EPA**
- Splits: **vs man/zone, vs blitz, under pressure vs clean, 2-high vs single-high shells**
- WR/TE health & target share; ability vs **press/man**; separation vs coverage grades
- OL pass protection: **pressure rate allowed, true pass set grade, quick-game rate**

Defense vs Pass

- **Pressure rate (true pressure), pass rush win rate, stunt/twist usage**
- Coverage: **man/zone rates, EPA allowed by coverage, explosive pass rate allowed, CB health (top-2 CBs)**

- Safety depth/injuries (2-high integrity)

Run Game & Trenches

- Off run: **SR, EPA, gap vs zone efficiency, YBC/YAC, short-yardage conv%**
- Def run: **SR/EPA allowed, missed tackles, interior DL health**
- OL run block vs DL run stop (power/duo vs wide zone fits)

Situational & Coaching Tendencies

- **Neutral-situation pass rate** (score within ± 7 , 1st–3rd qtrs), **pace**, motion/shift usage
- **4th-down aggressiveness, 2-pt tendencies, timeout/game-mgmt edge**
- Red zone offense/defense (stabilize w/ rolling 4–6 week sample + multi-year priors)

LAYER 3: Form, Health & Practice/Intel

- Rolling **3–5 game** differentials: net EPA/play, net SR, early-down success, explosive diff, starting field position
- **Injury report with impact weights** (QB > LT/RT > WR1/CB1 > iDL/EDGE > S/LB > RB/TE). Flag **cluster injuries**.
- **Offensive line continuity** (starting 5 together?)
- **Return from injury** with likely snap/training limitations
- **Camp/beat reports**: new install wrinkles, schematic changes, emergent rookies
- **Travel fatigue** (international, west→east early kickoff), **practice disruptions** (wildfires/air quality, facility issues)

Rule: If QB status is truly uncertain or OL/CB cluster injury risk is high, cap **Confidence ≤ 5** .

LAYER 4: Venue, Weather & Macro Context

- **Stadium:** dome vs outdoors, **surface** (turf vs grass) team splits
 - **Altitude** (DEN), **humidity/heat**, **wind** (≥ 15 mph materially affects pass/FG; ≥ 20 mph: strong downgrade)
 - **Historical performance:** team/QB in similar conditions (outdoors @ $<40^{\circ}\text{F}$, wind ≥ 15 mph, short week TNF, post-bye)
 - **Time zone:** body-clock disadvantage (e.g., West coast 10am PT kick)
 - **Refs** (optional): crew tendencies for defensive holding/DPI that can swing pass offenses
-

LAYER 5: Market, Price & Probability Edge

For each side, compute:

- **Implied Prob (American odds)**
 - For favorites ($-A$): $A / (A + 100)$
 - For dogs ($+A$): $100 / (A + 100)$
- **Your Projection (Win %)** based on weighted model (Layer 1–4).
- **Edge (ppt)** = $(\text{Your Win \%} - \text{Market Implied \%}) \times 100$.
- **Hold sanity check** across both sides; if you have multiple books, compare to **sharpest** book (Pinnacle/Circa) and **consensus**.
- Note **line movement** (open $\rightarrow$ current), **public vs sharp splits** (tickets vs handle), and **injury/news catalysts**.

Bet rule: Only recommend when **Edge ≥ 3 ppt** and no red “uncertainty flags.”
Prefer **≥ 5 ppt** for standard plays. If the edge is built on unstable stats (TO luck/def TDs/3rd-down outlier), reduce stake or pass.

MODEL WEIGHTING & STABILITY RULES

- **Recency:** Last 18 months = 60% (heavily weight current season & last 8–10 games), older = 40%.
 - **Stabilizers:** Favor **EPA & SR** (more signal) over raw yards/3rd-down %.
 - **Regression flags:** extreme TO margins, non-offensive TDs, unsustainable RZ TD% swings.
 - **Injury overrides:** Adjust projection when QB or ≥ 2 OL starters are out; apply **matchup penalties** (e.g., weak RT vs elite LDE).
 - **Weather overrides:** Wind ≥ 18 –20 mph $\rightarrow$ lower pass EPA, kick range; elevate run/short-game; dome teams outdoors in cold/wind – small penalty.
-

REQUIRED OUTPUT

Return a table with **one row per game**:

Game • Moneyline Pick • Best Odds • Your Implied Win % • Market Implied % • Edge (ppt) • Confidence (1–10) • One-Liner Rationale

- *Your Implied Win %* = your projection
- *Market Implied %* = from best available price for that side
- *Edge (ppt)* = (Your% – Market%)

Then add ≤ 100 words of notes per game referencing **all 5 layers**.

GUIDELINES FOR ACCURACY & RISK

- Use **at least two stat sources** (e.g., team EPA/SR databases, play-by-play, injury reports). If stats conflict, **flag it** and **avoid** if edge < 3 ppt.

- Explicitly **mention variance** drivers (QB volatility, weather, OL injuries, explosive-play dependence).
 - **Stake discipline:** downgrade confidence when edges rely on unstable metrics or uncertain injuries.
 - Be explicit: “**Pass**” if the price doesn’t meet thresholds.
-

STAT PACK (what the model should pull/check)

Team level (Off/Def):

- EPA/play, early-down EPA, SR, explosive play rate, drive EPA, red zone TD%, goal-to-go TD%, 3rd/4th-down (as context), penalties EPA
- Pace (seconds/snap), neutral pass rate, motion rate, shotgun/under-center split
- Special teams: punt/coverage EPA, kick/return EPA (use as tiebreaker)
- SoS-adjusted variants (if available)

QB & Passing:

- EPA+CPOE composite, aDOT, time-to-throw, pressure-to-sack, TWP%, big-time throw rate, scramble EPA
- Splits vs **man/zone**, **blitz** rate, pressure vs clean
- WR/TE availability, target share, vs man press success, drop rate

Trenches & Run:

- OL: pressure rate allowed (true), pass block efficiency, blown block rate, penalties
- DL: pressure rate, pass rush win rate, double-team rates (if available)
- Run Off/Def: SR/EPA, YBC/YAC, short-yardage success, missed tackles

Context:

- Rest/travel (bye/mini-bye/short week, miles, time zones)
- Venue/weather: temp, wind, precip, surface; dome vs outdoors split
- Coaching: 4th-down aggressiveness index, neutral pass, situational tendencies

Market:

- Best current ML by side, openers, movement, tickets/handle split (if available), book quality (sharp vs square)

PROJECTION METHOD (transparent math)

1. Baseline team rating from **rolling EPA/play differential** (off – def), SoS-adjusted.
2. Apply matchup adjustments (coverage fit, pass rush vs OL, run fit) → **matchup delta**.
3. Apply **injury/availability** adjustments (positional weights).
4. Apply **venue/weather** adjustments (HFA, wind/cold penalties/boosts by team profile).
5. Convert rating differential to **win probability** via logistic curve calibrated to historical NFL spreads/MLs.
6. Cross-check with the market; if far off without data justification → reduce confidence.

(You can simply state your final win % if you're not showing all internals.)

EXAMPLE OUTPUT ROW (format)

Game: Cowboys @ Eagles • **Pick:** PHI ML • **Best Odds:** -130 (Circa) • **Your Win %:** 58.7% • **Market %:** 56.5% • **Edge:** +2.2 ppt • **Confidence:** 6/10 • **Why:** PHI trench edge vs DAL RT, man/zone fit favors A.J. Brown vs single-high, small wind suppresses DAL deep game, Eagles off mini-bye; monitor DAL CB cluster.

Notes (≤100 words):

L1 SoS-adj net EPA favors PHI last 8–10. L2 pass rush vs RT mismatch; DAL pressure-to-sack

high vs PHI's quick-game. L3 DAL CBs banged up; OL continuity better for PHI. L4 mild wind outdoors trims DAL explosives; home-field. L5 small market edge; if number drifts to -140, edge shrinks—target -130 or better.

PROMPT (copy/paste to run each week)

You are my NFL Moneyline Model. Analyze the slate using the 5-Layer framework below. Follow weighting (last 18 months = 60%, older = 40%). Use at least two stat sources for cross-checks. Flag conflicts; PASS if edge < 3 ppt or if uncertainty is high (QB/OL/CB cluster or weather). Output the table and ≤100-word notes per game.

INPUT:

[PASTE WEEK & GAMES WITH ODDS HERE]

FRAMEWORK TO APPLY:

- L1 Résumé & SoS: EPA/SR (off/def), early-down EPA, explosive diff, drive EPA, ST value, SoS, rest/travel, turnover luck adj, close-game luck.
- L2 Technical Matchups: QB (EPA, CPOE, splits vs man/zone & blitz, pressure vs clean), WR/TE health, OL vs pass rush (pressure/PRWR), run O/D (SR/EPA), coaching (neutral pass, pace, 4th-down).
- L3 Form & Health: rolling 3-5G EPA/SR diffs, cluster injuries (QB/OL/CB prioritized), OL continuity, return-from-injury limitations.
- L4 Venue/Weather: wind/temp/precip, surface, dome/outdoor splits, altitude/time-zone kickoff, historical comps.
- L5 Market & Price: compute market implied %, your win %, Edge (ppt), line movement, sharp/public splits; PASS if Edge < 3 ppt.

OUTPUT TABLE COLUMNS:

Game • Moneyline Pick • Best Odds • Your Implied Win % • Market Implied % • Edge (ppt) • Confidence (1–10) • One-Liner Rationale

Then provide ≤100-word notes per game referencing all 5 layers.
Mention variance and responsible staking.

QUICK REFERENCE: ODDS MATH

- **Implied % (fav -A) = $A / (A + 100)$**
- **Implied % (dog +A) = $100 / (A + 100)$**
- **Edge (ppt) = $(\text{Your}\% - \text{Market}\%) \times 100$**
- **Confidence guide:**
 - 9–10: ≥ 7–8 ppt edge, stable weather/injuries, multi-angle matchup edge
 - 7–8: 5–7 ppt edge, minor uncertainty
 - 5–6: 3–5 ppt edge or one meaningful uncertainty flag
 - ≤4: pass or tiny lean only

VARIANCE & BANKROLL NOTES

- NFL outcomes hinge on **explosive plays, turnovers, and 4th-down swings**—even perfect reads will lose sometimes.
- Down-weight edges driven by **unsustainables** (def TDs, TO spike, extreme 3rd-down).

- Keep unit sizing consistent; scale down in **wind ≥ 20 mph**, **QB questionable**, or **OL/CB cluster** situations.
